q=HCL)

Suggest Edit

Given a linked list, remove the nth node from the end of list and return its head.

For example,

Given linked list: 1->2->3->4->5 , and  $n = 2$  .

After removing the second node from the end, the linked list becomes 1->2->3->5 .

### “ **Note:**

1. If n is greater than the size of the list, remove the first node of the list.

”

Try doing it using constant additional space.
